# **Letter to the Community**

Releasing these findings is a crucial step in building a healthier community.

Dr. Martha Buchanan,
 Director, Knox County
 Health Department

To effectively respond to the health needs of our community, we must have a deep understanding of the challenges we face. This report, which outlines the priority health issues for Knox County, is the culmination of more than one and half years of data collection and evaluation. This extensive process, based on a national model, involved dozens of partners and thousands of residents.

We are uniquely positioned to conduct this work because of our expertise in this area, namely in our epidemiology division. Even so, we devote time and resources to this for a variety of reasons. This assessment is not only a crucial part of our own strategic approach to improve health, but it also informs the work of our partners, medical providers, nonprofits and many others. In addition, we produce this report in support of the Community Health Council's health improvement plan, which brings together a diverse group of organizations from across the community.

The Community Health Assessment draws on data and information gathered from four assessments recommended under the national Mobilizing for Action through Planning and Partnerships (MAPP) framework. All of the information gathered from the assessments was then synthesized by our epidemiologists, resulting in the 14 topic areas outlined. The topic areas were determined either by statistical relevance using a variety of valid sources, or were cited repeatedly during key informant interviews and focus groups.

As you'll read in this report, some groups of people have higher rates of certain diseases compared to others. We have noted these differences when they are statistically significant. It is important to recognize these disparities because race, ethnicity, gender, socioeconomic status and other social factors can play a major role in an individual's health. Therefore, to improve the health of everyone in our community, we must be aware of and address these social determinants of health.

This is the second Community Health Assessment we've conducted; the first was in 2010. As part of our commitment to improving the health of our community, we plan to release a similar assessment every few years, and we hope they serve as useful tools and references for all readers. If you have any questions or suggestions for future reports, please contact our Director of Community Assessment at 865-215-5095.

Sincerely,

**Dr. Martha Buchanan** 

Director, Knox County Health Department

# **Community Health Assessment: Health Priorities**

#### Introduction

The 2014-2015 Community Health Assessment was conducted by the Knox County Health Department in support of Together Healthy Knox, an initiative of the Community Health Council. Created in part to guide a community health improvement process, the council is an independent entity made up of various community members that serves the City of Knoxville, Knox County and the Town of Farragut.

This assessment details the priority health issues for Knox County after consideration of all the data collected. The Community Health Council will select four top issues from this assessment to integrate into a Community Health Improvement Plan.

#### Methodology

In 2014, the Knox County Health Department held monthly meetings with partner agencies to organize and coordinate the assessment data collection process (12 focus groups, 26 key informant interviews, a quality of life survey with more than 2,000 responses, etc.). Once the qualitative assessments were underway, the meetings were used to review the 2010 Knox County Community Health Assessment to determine any new data needs. Additionally, the Knox County Health Department epidemiology staff reviewed local and state health assessments for methodology and data collection comparisons. Information from the Behavior Risk Factor Survey (BRFS), conducted every three years in Knox County, and the Youth Risk Behavior Survey (YRBS). conducted every two years in Knox County public middle and high schools, was combined with local birth, mortality and disease prevalence data. To set a benchmark, the data were compared to the applicable targets outlined in Healthy People 2020, a national set of standards created to improve health. The health department's epidemiology staff also noted areas of limitation in which County-level data were not available. All data were evaluated to reveal the health issues for Knox County. These health issues were then narrowed down to 14 topic areas that represent the priority health issues for Knox County. Public input on a summary of this assessment was sought in person and online in June 2015. Obesity, nutrition and physical activity were most commonly cited as major community issues.

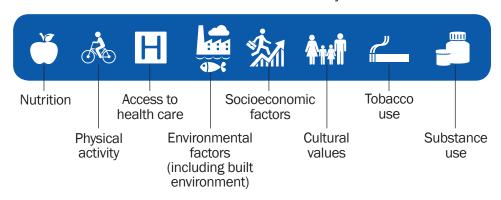

#### **Community Description**

Approximately 448,644 individuals reside in Knox County based on 2014 estimates. Since 2010, the population has increased nearly four percent. The average Knox County resident is 37 years old and 14 percent of the population is over 65 years old. The makeup of Knox County is slightly more female than male and predominantly white. Black individuals make up nearly 10 percent of Knox County's population with individuals of other races and ethnicities making up five percent. The median annual household income for Knox County residents is \$47,694 with 14.6 percent of all residents living below poverty level. Approximately 1 in 5 children in Knox County are living below the poverty level. More than 93 percent of Knox County residents completed high school, and 33 percent hold a bachelor's degree or higher. Approximately 13 percent of Knox County residents report living with some type of disability.

#### **GRAPHICS KEY**

The symbols below represent contributing factors to the health issues described in this report. Look for these symbols in this report to learn about root causes of health issues in Knox County.

The Knox County Health Department epidemiology staff identified the following health priorities for the county, based on all data collected. This information was presented to the Community Health Council for review.

TOPIC AREAS IDENTIFIED	HEALTH PRIORITIES
Access to Health Services	Increase health coverage for Knox County residents (emphasis on unemployed)
Cancer	<ul> <li>Decrease lung cancer mortality</li> <li>Increase radon awareness</li> </ul>
Diabetes	See obesity, nutrition, physical activity
Environmental Health	Increase access and availability of safe greenways, sidewalks and parks
Food Access	<ul> <li>Increase access and availability of healthy food versus unhealthy food</li> <li>Address potential misconceptions around perceived cost of healthy food versus unhealthy food</li> </ul>
Heart Disease	See obesity, nutrition, physical activity
Injury and Violence	<ul> <li>Decrease bullying among adolescents</li> <li>Decrease poisoning deaths (especially those related to opioid and meth use)</li> </ul>
Maternal, Infant and Child Health	<ul> <li>Increase the number of women receiving adequate preconception/prenatal care</li> <li>Decrease Neonatal Abstinence Syndrome (NAS) incidence</li> </ul>
Mental Health	<ul> <li>Increase access to mental health services</li> <li>Decrease depression/suicidal thoughts among adolescents</li> </ul>
Obesity, Nutrition, Physical Activity	<ul> <li>Decrease screen time in youth</li> <li>Increase availability of physical education in schools</li> <li>Decrease unhealthy food choices</li> </ul>
Oral Health	<ul> <li>Increase access to oral health services for youth, the unemployed and those unable to work</li> </ul>
Reproductive and Sexual Health	Increase birth control education
Substance Use	<ul><li>Decrease opioid abuse</li><li>Decrease marijuana use and binge drinking in youth</li></ul>
Tobacco Use	Decrease tobacco use, particularly in youth and pregnant women

# **Health Priorities** and Areas of Concern

- · Access and availability of safe greenways, sidewalks
- Built environment factors contributing to poor health

# **√FACT**

Only 23 percent of individuals live within one-half mile of a park in Knox County. Data show a lack of access to parks contributes to a sedentary lifestyle and obesity.

# Air Quality **Knox County** has met Healthy People 2020 goals in 2013 and 2014. Prior to that. air quality was slowly improving

In the past

have been

no reported

waterborne

connected to

County.

any of our utility

decade, there

 Drinking water Waterways Since 2004, 500 miles of waterways have been added to the region's list of impaired disease outbreaks waterbodies in East Tennessee. meaning they providers in Knox are not safe for swimming or fishing.

Source: Tennessee Department of Environment and Conservation and ET Index Livability Report Card 2015. Plan East Tennessee

# Safety

The Knox County Health Department performed an analysis of automobile-pedestrian and automobile-bicycle crashes in Knox County that occurred Dec. 2006 - June 2011, based on data provided by the Knoxville Regional Transportation Planning Organization (TPO).

#### In that time period, there were 494 crashes involving pedestrians or bicyclists.

Of those: • 348 crashes involved pedestrians

- 145 crashes involved cyclists
- 1 crash involved both

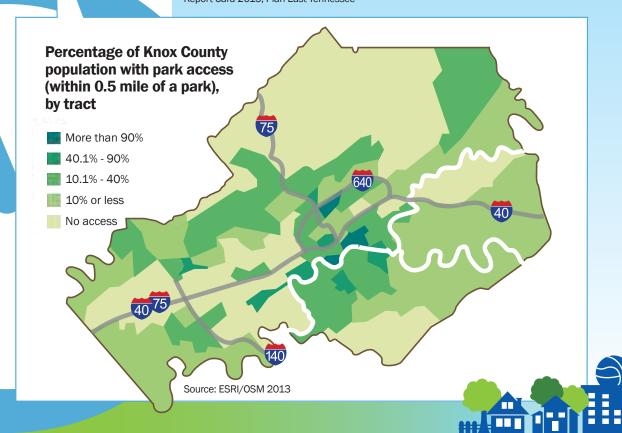

Given the relatively small percentage of pedestrians and bicyclists in Knox County the statistics reinforce the importance for everyone to safely share our roads.

Source: Pedestrian/Bicycling Crash Data Assessment for Knox County, Tennessee, 2012

# **Contributing Factors**

# despite a growing population.

# **Housing Disparities**

**29.7 percent** of housing in Knox County meets one or more of these four conditions:

- · Lack of complete plumbing
- · Lack of complete kitchen facilities
- Gross rent or selected owner costs are greater than 30 percent of household income
- More than one person per room is living in the household

These factors can contribute to poor health in multiple ways.

Source: Economic Research Service of USDA, 2007-2011 or Knox County Community Health Status Indicators, 2015

# **Drinking water demand**

While there is a sufficient water supply available in East Tennessee at present, there is a rapidly increasing demand for drinking water that must be addressed in planning for the future.

### **Benchmarks**

- Knox County meets several goals for healthy drinking water supplies addressed in *Healthy People 2020*.
- Knox County also meets the Healthy People 2020 target for air quality, which aims to reduce the number of days the Air Quality Index (a figure created to measure outdoor air pollution) exceeds 100. In 2013 and 2014, Knox County Air Quality Management's monitoring stations recorded no days with AQI over 100.

Source: ET Index Livability Report Card 2015, Plan East Tennessee

# **Walkability**

A 2014 study found that, excluding the elderly, residents of neighborhoods with greater walkability had on average 13 percent lower development of diabetes over 10 years versus those in less walkable neighborhoods. Obesity was also lowest in the most walkable neighborhoods.

 People living in highly walkable neighborhoods are three times more likely to walk or bicycle and half as likely to drive as a means of transportation.

- A 2013 survey by the National Association of Realtors found that
   8 in 10 Americans prefer being in a community that offers sidewalks and good places to walk.
- Six in 10 prefer a neighborhood featuring a mix of houses, shops and services within an easy walk versus a neighborhood that requires a car for every errand. Prices are higher and time to sell shorter for homes with sidewalks.

Sources: National Association of Realtors' National Community Preferences Survey, October 2013; Diabetes.org website, Do "Walkable Neighborhoods Reduce Obesity, Diabetes?" June 2014; Knoxville Regional Transportation Planning Organization, April 2013

- Multiple greenways and parks in the area
- City of Knoxville Complete Streets Ordinance
- Safe Routes to School Partnership
- Legacy Parks Foundation
- Knox and Blount counties and a portion of Anderson County are now considered to be in attainment, a U.S. Environmental Protection Agency declaration that the area complies with key air-pollution standards.

# **Food Access**

### **Health Priorities and Areas of Concern**

- Access and availability of healthy food versus unhealthy food
- Potential misconceptions around perceived cost of healthy food versus unhealthy food

### **Benchmarks**

• Diet Choices/Food Deserts

Knox County high school students surveyed consistently eat fewer fruits and vegetables than state or national averages, a risk factor for obesity. In the YRBS, when high school students were asked if they ate five or more servings of fruit or vegetables during the previous week, the percent answering "yes" consistently fell 1-2 percent below state percentages and 4-5 percent below national percentages.

According to the USDA, food deserts are communities without ready access to fresh, healthy, and affordable food. The low-income neighborhoods shaded in dark green on the map at right have less access to markets where their families can obtain fresh fruits and vegetables.

# 39 percent

of Knox County students qualify for free or reducedcost breakfast and lunch.

Non-Hispanic black women were at greater risk for having a low birth weight child and/or pre-term delivery compared to women of other races/ethnicities.

Sources: 2013 vital records provided by the Office of Policy, Planning and Assessment, Tennessee Department of Health

### **Preterm Births**

Preterm birth (birth before 37 weeks gestation) is the leading cause of newborn death in the U.S. Infant mortality is higher for infants born with inadequate prenatal care. Babies who survive an early birth often have breathing problems, cerebral palsy, intellectual disabilities and other lifelong problems. Even babies born just a few weeks early have higher rates of hospitalization and illness than full-term infants. In addition, preterm births cost the nation more than \$26 billion annually, according to the Institute of Medicine.

- Premature births accounted for 16.9 percent of all infant deaths in the U.S. in 2010.
- That same year, the rate of infant deaths due to prematurity and low birth weight was 145.9 deaths /100,000 live births for Tennessee, compared to 103.8 deaths /100,000 live births in the U.S.

# **Neonatal Abstinence Syndrome**

In addition to the human cost, the average monetary cost to stabilize a newborn with Neonatal Abstinence Syndrome (NAS) is \$62,973 versus \$7,258 to stabilize a newborn not suffering withdrawals. The Tennessee Department of Health estimates that from January to October 13, 2013, NAS cost the state \$36,771,900.

- In the 2014 state NAS report, Knox County had the highest percentage (11 percent) of NAS cases.
- In 2014, 36.6 percent of NAS cases in Knox County were attributed to illicit drug use, 27.7 percent were attributed to prescription drugs, and 35.7 percent are a combination of the two.

**Unable to work** 

**Smokers** 

#### Moms who smoke

during pregnancy are at a greater risk for having a low birth weight and/ or preterm delivery compared to moms who do not smoke during pregnancy.

obacco use increases the risk of cancer, heart disease, stroke and respiratory illnesses to name a few, but the list is exhaustive as tobacco use impacts every organ of the body. Half of all current smokers who continue smoking will die from a tobacco-related illness.

Diseases of the respiratory system are the No. 1 reason for hospitalization among children 1-9 years old. Secondhand smoke

exposure has a significant impact on the occurrence of respiratory illness, especially among youth.
