In 2016, the Regional Forensic Center introduced the Yearly Drug-Related Mortality Report to identify overdose trends in the community and identify the individual and societal forces behind substance abuse and drug addiction related deaths. Recent data confirms that drug overdose mortality is an accurate reflection of the general health status of a community and society at large.

In 2019, the Knox County overdose deaths decreased 9.8% compared to the 3.2% increase in 2018, though raw data collected during the first two quarters in 2020 do project a surge in the other direction. Anderson County drug overdose deaths dropped 11.6% in 2019, which a smaller decrease compared to the 30% decline in 2018.

Fentanyl and its analogues continue to be responsible for most deaths in Knox County; the same was true for Anderson County. In keeping with the previous year’s trend, fentanyl, with or without analogues and/or heroin, is frequently combined with methamphetamine as the preferred “speedball” combination. Moreover, these drugs continue to play an important role in other terminal events such as motor vehicle accidents, falls, firearm injuries and suicides (by a variety of methods).

In both service counties, men continued to be disproportionately affected by drug overdose compared to women (65% men/35% women in Knox County and 54% men/46% women in Anderson County). In more of an urban area such as Knox County, the ratio of black to white overdose deaths is 1 to 9, which is reflective of the community’s demographic makeup.

As federal regulatory agencies tighten the rules and policies with respect to fentanyl and fentanyl analogues, new synthetic drugs have begun to flood the illicit drug market. This office was the first Regional Forensic Center in Tennessee to identify two new strong drugs in overdose deaths; these were isotonitazene (a novel synthetic opioid) and flualprazolam (a benzodiazepine analogue), which will be discussed more extensively in next year’s Drug-Related Death Report.

It is important to note that snorting or intravenous application remain the two main modes of administration for these drugs; these methods enable the introduction of a sudden surge of concentrated powerful drugs to the body’s circulation. Frequently, individuals utilizing these methods collapse and die before they can snort or inject their entire dose. In these situations, naloxone might not work regardless of how quickly or how much of a drug has been administered, as shown in the table on the last page of this report. The addicts who do survive overdose frequently succumb to other medical complications such as bacterial endocarditis with or without sepsis, strokes, hepatitis C resulting in cirrhosis, among other circumstances.
The purpose of making this data widely available is to advance the discussion regarding addiction and invite our communities to find measures to further curb and prevent drug-related deaths.

Darinka Mileusnic-Polchan, MD, PhD
2019 Drug Related Death Statistics

2019 Key Findings

The overdose epidemic in Knox County, which is analogous to the national epidemic overall, continues to grow in magnitude, but is also changing its character1. In 2019, 293 people died from drug overdose in Knox County and 28 people died in Anderson County. Preliminary data for drug-deaths in 2020 does unfortunately indicate an upward trend for drug-related death cases in Knox County. Drug overdose deaths increasingly involve synthetic opioids (fentanyl and fentanyl analogs) with the numbers of prescription opioids (oxycodone, oxymorphone, hydrocodone, etc.) decreasing.

2019 Report Highlights for Knox and Anderson Counties:

- Knox County showed a 9.8% decrease in drug-related deaths from 2018 to 2019; Anderson County showed a 11.6% decrease in drug-related deaths from in that same time.
- Fentanyl and fentanyl analogues (synthetic opioids) were the most frequently identified drugs in drug-related deaths in 2019.
- Polypharmacy, which is when more than one drug is responsible for death, was involved in 69% of Knox County and 71% of Anderson County overdose deaths.
- The five most common drugs identified in drug-related deaths in 2019 were synthetic opioids, methamphetamine, alcohol/ethanol, heroin and cocaine.
- Prescription opioid related deaths continue to decrease in RFC jurisdictions.
- People 45-54 years old experienced the most drug related deaths in Knox County, but the sharpest increase was in people age 35-44. The sharpest decrease was people 15-24 and 25-34.

Data and Methods

The Knox and Anderson County Medical Examiner database (MDIlog) was queried for possible drug related causes of death for cases accepted as medical examiner jurisdiction for January 1, 2019, through December 31, 2019. The initial query included non-motor vehicle accidents, undetermined and suicide manners of death. The initial data set was examined to ensure that all cases included were drug-related deaths, as determined by the forensic pathologist of record. Causes of death related to chronic effects of drugs and alcohol such as bacterial endocarditis, chronic ethanol use and others, were excluded from this dataset.

Zip Code Distribution and Heat Maps by Year and County

The following zip code data represents the home addresses, location of injury and death locations for drug related deaths in Knox and Anderson counties, which had an autopsy or examination at the Knox County Regional Forensic Center in 2019. The data source and notes are listed here for the zip code related pages.

KGIS assisted by creating the enclosed heat maps. These maps represent drug related deaths based on home address, location of injury, or location of death.

Data Source

Notes
1. The home address location maps represent the address at which the people who died of a drug related death resided.
2. The location of injury maps represent the address where drug related injury occurred.
3. The death location maps represent where people died from the drug related death. Hospital locations were added to the maps for reference.

Data Source: Knox County RFC Medical Examiner Database 2010-2016 and MDILog Database 2016-2019 Knoxville, TN

Note:
1. This report only notes the presence of the drugs contributing to death, but does not indicate the appropriate or legal use of a drug
2. Drug poisoning deaths may involve more than one specific substance.
3. Some drugs are listed as Not Otherwise Specified (NOS) because information was obtained from sources that did not define the drug type.
